

Programming Exercise

Questions

For each question, explain your reasoning.

1. What is the solution to this error?

SyntaxError: invalid syntax. Maybe you meant '==' or ':=' instead of '='?

Answer:

This error happened because there was the use of the assignment operator (=), instead of the comparison operator (==) in the if condition. These operators are different because the '=' operator is used to assign a value while the '==' operator is used to check whether the values are similar or not. If `n = 0` or `n = 1` was then changed to `n == 0` or `n == 1`.

2. What was your solution to printing the Fibonacci numbers from 1 to 10 instead of 0 to 9?

Answer:

In order to start generating Fibonacci numbers ranging from 1 to 10, I changed `range(0,10)` to `range(1,11)` in my for loop. This is due to the reason that the Fibonacci sequence starts from 0, thus, changing the `fib(i-1)` function to generate the Fibonacci number as `i: 1 fib: 0` and `i: 10 fib: 34`.

3. What is the solution to this linting issue?

Answer:

The reason why the error occurred is that the name of the function "Fib" does not match the naming rules mentioned for naming functions in Python based on the PEP 8 guidelines in which the names of functions should have been in snake case. This problem was sorted out by changing the function name from "Fib" to "fib".

 Function name "Fib" doesn't conform to snake_case naming style pylint(invalid-name) [Ln 2, Col 1]
